**Did you know** that about 15% of children between the ages 6-19 have hearing loss of at least 16 decibels in one or both ears?\*

Hearing loss and other hearing impairments can cause both social and academic challenges for students of all ages. In serious cases, they can also have devastating effects on a child's development. Mild hearing impairments often show similar signs of inattention and poor behavior in the classroom, which can sometimes lead to an impairment going by undetected.

Providing consistent screenings, trainings, and follow-ups can ensure that early detection of hearing loss or impairments are identified and referred in a timely manner.
